

Minds & Models

The **who-layer** of retail measurement.

Physical retail knows what sold.

We know who bought.

Every source a brand buys today can tell it what sold, where, and at what price.

**None of them
knows who bought.**

E-commerce has known its shoppers for twenty years.
Roughly nine in ten FMCG euros are still spent in a store,
where nobody does.

HOW A BRAND GETS SHOPPER DATA TODAY

Sell-out and POS data

Every receipt, every store, every week.

- No person attached to the basket

Consumer panels

A few thousand recruited households, projected to the market.

- Self-reported, and months late

Loyalty card data

One retailer, its own card holders.

- Blind to everyone else, and to every non-buyer

We read the shopper, then match them to the receipt.

01 · THE VISUAL LAYER

Who is standing there

- **100+ visual attributes** per shopper
- Read on the store's own cameras
- Processed on the edge, nothing identifiable leaves the store

02 · THE POS MATCH

What they actually bought

- Every visit joined to **its own receipt**
- Behaviour tied to a verified purchase
- **Not sold by anyone in Europe today**

03 · THE PRODUCT

The category read

- A **slot**: one category in one channel, built once
- A **seat**: one brand's annual subscription
- Sold to every brand in the category

WHICH IS WHY THE ECONOMICS WORK

Revenue scales with seats. Cost scales with slots. A seat opens at €40k and reaches €170k as more chains join the read, without anyone selling anything again.

THE ASSET

Ask it the questions the receipt cannot answer.

“Which shopper actually buys our **energy drink before 8am**, and what else is in that basket?”

→ Re-cut the morning media plan and the chiller planogram to the segment that converts

“Who pays **full price** for deodorant, and who **waits for the promotion**?”

→ Stop funding discount on the segment that would have paid anyway

 chat.mindsmodels.ai

IT IS LIVE. ASK IT ANYTHING.

“How does our shopper mix differ between **convenience** and **drugstores**?”

→ Different pack size, price tier and listing argument per channel

“Which **competitor's shopper** looks most like ours, and where do they overlap?”

→ Aim the switching campaign at the audience that is actually winnable

Green line is the decision the answer unlocks. No facial recognition, no identities, no biometric templates. Aggregate outputs only, $k \geq 25$.

The side that has the data does not pay. The side that needs it does.

SUPPLY AND RIGHTS

The retailer

- Cameras it already owns
- The POS feed for the same stores
- **Pays nothing.** Takes a revenue share

THE LAYER

Minds & Models

- Reads the shopper, matches the receipt
- Holds the perpetual aggregate rights
- Builds each category read once

THE PAYER

The brands

- Annual seats, one per category
- On measurement budgets that already exist
- Sold to every brand in the category

DATA AND RIGHTS

MONEY

WHY THIS ONE CAN MOVE FAST

No cheque from the retailer means **no budget line, no CFO and no procurement committee.**

TRACTION

Tested with the operators and brands that define these categories.

Four retail verticals live, receipt-level matching running at two chains, and the demand side already at the table.

shopper

Every store,
every month,
adds to the
same asset.

**This is what an acquirer buys,
and it is the only part of this
business that cannot be rebuilt
from scratch.**

THE PLAN

€20.3M of ARR by 2031.

GROSS MARGIN

71% → 77%

It rises with scale, because the second seat in a slot is nearly free to serve

SEVEN MARKETS BY 2031

Czechia and Slovakia, Poland, DACH, France and Benelux, Nordics and Iberia, the United States

TOP-DOWN CHECK · IS THE MARKET ACTUALLY BIG ENOUGH

\$18bn

Global consumer measurement, as the incumbent sizes its own market

NIQ FORM S-1, SEC, 2025

→ 23,000

Companies already buying it from that one incumbent, at ~\$173k a year each

NIQ FORM S-1; AVERAGE IS IMPLIED

→ 169

Brand seats is our entire 2031 plan. 0.7% of one incumbent's client list.

MINDS & MODELS FINANCIAL MODEL

WHY THIS IS WORTH BUILDING

Everyone says data is the new oil. The market already pays for it that way.

4.5×

Software, when it is acquired

Median revenue multiple across **543 disclosed SaaS transactions**. The 2025 median was 3.8×

AVENTIS ADVISORS, SAAS M&A 2015–2026

8.9× – 14.1×

Listed data infrastructure, today

Verisk trades at **8.9× revenue growing 5%**. MSCI at **14.1× growing 12%**. Owned data, sold on subscription.

PUBLIC COMPARABLES, SEPTEMBER 2026

10×

What this plan is underwritten at

Inside the band above, not beyond it. On €20.3M of ARR that is a **€200M outcome**.

MINDS & MODELS FINANCIAL MODEL

Software can be rewritten

A rights portfolio negotiated chain by chain cannot.

Data compounds

Every chain and every month adds to the same asset. Software ages from the day it ships.

The buyer is strategic

The incumbents sell the what-sold half already. They cannot assemble the who half themselves.

Meet the team.

01

Signed data mandates

On the chains already instrumented. This is the one thing every euro of the plan depends on.

02

Two categories live

Instrumented end to end and producing a continuous, sellable read.

03

The first paying seats

Delivered studies converted into annual brand subscriptions, billed in advance.

10 months

of runway, to the point where the next round is priced on signed revenue

€676k

ending ARR by 2027 on the plan this round starts

21 Nov 2026

rolling close, targeted

Minds & Models

Appendix

The numbers behind every claim in the deck, straight from the model. Four pages: unit economics, the plan year by year, the full exit ladder, and what breaks it.

Why the margin rises instead of flattening.

METRIC	2027	2029	2031	READ
Gross margin	71.2%	72.0%	77.1%	Cost follows slots, revenue follows seats
Net revenue retention	444%	129%	113%	Computed from slots crossing the price gates, not assumed. Early years sit on a base of one to three slots and are comparatively meaningless
ARPU per brand seat	€94.8k	€93.5k	€120.0k	Against a \$50k floor and a \$75-500k enterprise band at the incumbent
LTV / CAC	11.6×	7.3×	7.4×	Falls as founder-led selling is replaced by a real commercial organisation. That is normalisation, not deterioration
CAC payback	5.2 mo	8.3 mo	8.2 mo	Fully loaded: all sales, retailer BD and marketing payroll plus programs
Live slots · seats each	3 · 2.4	19 · 2.7	53 · 3.2	A slot is one category in one channel. Six brands per category are large enough to buy; the model sells 55% of that
Rule of 40	406	71	86	ARR growth plus EBITDA margin

APPENDIX · THE PLAN AND THE CAPITAL

Six years, and what each round pays for.

EUR	2026	2027	2028	2029	2030	2031
Ending ARR	95k	677k	2.07M	4.78M	11.45M	20.29M
Revenue recognised	24k	296k	1.28M	3.52M	8.36M	16.43M
EBITDA	(84k)	(617k)	(2.03M)	(2.09M)	(1.84M)	1.42M
Closing cash	503k	1.81M	4.19M	2.92M	3.08M	7.15M
Headcount	8	15	29	49	81	88

ROUND	WHEN	AMOUNT	POST	AT EXIT
Angel, done	Q2 2026	€80k	€3.5M	1.6%
Pre-seed	Nov 2026	€500k	€6.5M	5.7%
Seed	Sep 2027	€1.75M	€12M	12.6%
Series A	Nov 2028	€4.0M	€30M	13.3%

SEED

Opens Poland, pulls DACH forward, funds the second and third chain, and produces the first cross-retailer aggregated read.

SERIES A

Buys one thing: the United States, at a one-off entry cost of €600k. The largest measurement market in the world, and where the buyers of this company are.

€6.37M raised across all sources. Founders hold 60.1% at exit, the option pool 6.7%.

APPENDIX · THE EXIT LADDER

What each multiple assumes the buyer thinks they are buying.

MULTIPLE	EXIT VALUE	ON 2031 REVENUE	THIS ROUND RETURNS	WHAT THAT MULTIPLE PRICES
2.3×	€46.7M	2.8×	5.3×	Undifferentiated store analytics. A footfall incumbent in this category was acquired at about this level, which is the market's verdict on analytics sold without owned rights. This is the floor if the rights work fails.
4×	€81.2M	4.9×	9.2×	A rented asset. A licence the retailer can terminate is a service, and services in this category price here.
8×	€162.3M	9.9×	18.5×	An owned rights portfolio, at the low end of the measurement band.
10×	€202.9M	12.4×	23.1×	The plan. Midpoint of the measurement-currency band, priced against the buyer that already sells the what-sold half, is short the who half, and cannot assemble the rights itself.
12×	€243.5M	14.8×	27.7×	The same asset in a competitive process, or with more markets live than this plan carries inside its horizon.

The spread from 2.3× to 12× is roughly €200M of exit value, and it turns on whether the licence is perpetual and cross-chain rather than on the technology. That is why the data-processing terms sit in the assumptions of the financial model rather than in a legal annex.

The four questions worth asking, answered before you ask them.

What if the Series A never happens?

The United States never opens and 2031 ARR lands near half the base case. The company still never runs out of cash. **The Series A does not buy survival, it buys the American half of the exit.**

What if churn is three times the assumption?

Tested at 15% and 25% against a modelled 8%. The 25% case is what moved the Series A from €3.5M to €4.0M. At that size every one of the nine tested cases stays funded, with the low point between €223k and €298k of cash.

Is profitability too far out?

EBITDA turns positive in month 57 and stays positive, at €20.3M of ARR on €6.4M of total capital. The full-year 2031 margin of 8.7% averages six loss-making months with six profitable ones. **December run-rate is 17.9%.**

What is genuinely unproven?

Rights breadth. Everything above assumes we sign perpetual aggregate mandates chain by chain, and that is the constraint this round exists to remove. The exit ladder prices the case where we do not, and it still returns 5.3×.
