

You are spending on a shopper you have never seen. *Ask who they are.*

In-store is the largest discretionary line in a Czech FMCG business, and the only one still defended with the retailer's own sell-out curve.

● Forecourt & convenience

● Food retail

● Health & nutrition

● Pet specialist

WHERE THE MONEY GOES ON A GUESS

Three decisions you make every year, and cannot evidence when asked.

TRADE MARKETING · THE PROMOTIONAL LINE

Which shoppers am I discounting who would have bought anyway?

Sell-out comes late, in the chain's own format, and it is your only proof that a promotion worked. It cannot tell the display from the leaflet from the week. You defend the biggest line in your budget with a number you never measured.

CATEGORY AND KAM · THE ANNUAL NEGOTIATION

Who walked out without my category, and what did they buy instead?

Scan data says what sold. A 2,000-household panel says what people remember buying. Neither sees the shopper who weighed up your pack and bought something else. That shopper never reaches the annual negotiation.

BRAND MARKETING · THE BRIEF

My brief targets under-30s. Who is actually at the shelf?

Your target definition came from a tracker, a panel and the agency's segmentation. Nobody in that stack ever watched a real person choose. You are briefing an agency on someone none of you has seen.

WHAT WE PUT IN FRONT OF ALL THREE

Who paid full price and who waited for the deal.  **Night Dorm** buys nothing that is not discounted;  **Dawn Trades** never looks at the price. You fund both at the same depth.

The people who considered the category and walked out with nothing: how many they were, who they were, and at which hour. Nothing you buy today describes them, because they never paid.

Who is buying it now, observed rather than assumed.  **Young Streetwear** and  **Office Professional** buy the same category and share no media plan at all.

The coloured names are shopper groups the read itself produces, from what is visible in the store joined to what the receipts say. Page 5 shows where they come from. Shown here as examples of the output, not as a measured result for your category.

WHY NONE OF IT ANSWERS THE THREE DECISIONS

Your data is good. But all three of your sources only start once somebody has already paid.

Which means the shopper who considered your category and walked away with nothing is missing from every one of them. **Not as a gap in data quality. By design.**

Sell-out

Exactly what left the store, by product, by week, by chain.
The most precise outcome measure you can buy, and the number your own bonus is written on.

BLIND SPOT

It begins at the moment of payment. Everyone who picked your product up and put it back again is missing from it, and always will be.

The loyalty card

Where a chain runs a real card programme, it genuinely links a basket to a household and follows it over time. It is the strongest who-answer on the market today.

BLIND SPOT

It only sees people carrying the card, and only baskets that were paid for. In a forecourt or convenience trip, most shoppers do neither.

The panel

Projectable, comparable year on year, and the only instrument here that can legitimately say “the market” rather than “this store”.

BLIND SPOT

It asks people to remember, weeks later. It was never in the store at the moment the choice was made, and your competitors buy the same one.

HOW THE DATA GETS MADE

Two records. One shopper.

The hard part is that they are the same visit.

Who was in the store

The visual signature of the person standing in front of your product: age band with its error band, how they present, what they wear and carry, who they came in with, the hour they arrived. **88 visual attributes**, from a vocabulary of 450+.

- spending tier
- logo prominence
- watch type
- +85 more

What they bought

The receipt itself: which products, the price actually paid against list price, the value of the whole basket, and the minute it was rung up. **Every claim has a receipt behind it.**

Real receipt-level data. Not modelled, and not a projection.

One row, per shopper

105 DATA POINTS

Dawn Trades Trades and shift workers buying the same two things before 07:00

seen_at 06:12, Tue	store_id station	age_est 35-39	upper_brand engelbert strauss
wears_hi_vis yes	shoe_type work_boots	carried_item thermos	shopping_tool plastic_bag
outfit_functionality workwear	apparel_condition heavily_worn	apparent_spending_tier mid_range	individual_activity paying
bought Monster +2 items	price_paid_vs_list full price	basket_value_czk 118.40	+90 more

This row already exists **492,000 times**. Look at enough of them and the same combinations keep coming back, and that is what the groups on the next page are.

WHERE THE SEGMENTS COME FROM

From big data to shopper segments.

People you can actually brief against.

Shoppers who resemble each other pull together, and those groups are the segments. **Nobody drew them, and what reaches you is a person, not a cluster.**

“Your brand” is the line you name at the start of the pilot · share within a chain account is a number we do not measure and do not claim · trait indices are modelled from what is visible, never asked, and are not a clinical measure of anybody · indices against the store average, never counts of people · illustrative of the output, not a measured result for your category · every reported group sits above $k \geq 25$.

DELIVERY

One slide you can defend on Monday. Not just another login.

- ❏ **One slide, with its scope statement printed in its own footer**, because it will be forwarded without us in the room.
- ❏ **An Excel shaped like the report you already circulate**, one row per category pair, with the count printed on every cell.
- ❏ **A written read:** one finding, one so-what, two or three moves. In an organisation with no analyst, the interpretation is the product.
- + **Asked in your own words.** The same read answers follow-up questions in plain language, without a ticket to an analyst.

Minds & Models · ask · illustrative example

Compare promo share of spend for  **Night Dorm**,  **Dawn Trades** and  **Value Senior**, indexed against the store average.

Dawn Trades pays list. They buy the same two items before 07:00 whether or not anything is on promotion, and index at 41 against the store.

How this was counted: receipt lines joined to observed visits · promo flag from price paid against list · 4 segments, each above the k ≥ 25 floor. **Illustrative example, not a measured result.**

WHAT WE ARE ASKING FOR

Name the category and the chain.
Everything after that is optional.

Three rungs, and you can stop at any of them. **Three seats per competitive set, and never exclusive: your competitors can buy the same read, and our paper says so.**

RUNG 1 · NO MONEY

Letter of intent

You let us name you to the chain, and to investors under written confidentiality. Never publicly, never to press.

HOLDS One of three seats in your set, to 31 Mar 2027.

GETS YOU The first read, three months before anyone outside the three.

BINDS Nothing, except confidentiality. One page.

WHY IT MOVES

Your chain is not instrumented because nobody has told them a brand wants it. You telling them is the fastest route to your own read.

RUNG 2 · 300,000 CZK

One study, one question

A question you already argue about internally, answered on live stores. You pick it from three we can run today.

PAID On delivery. No deposit, no advance.

CREDITS 100% against the 2027 seat, if both are signed.

BUDGET Trade and shopper marketing. Not research.

IF IT DOES NOT HAPPEN

The order lapses if the retailer agreement is not in force by 31 Mar 2027, and nothing is owed by either side.

RUNG 3 · 1,000,000 CZK

A founding seat, 2027

A quarterly read: Excel, a written interpretation, a review call, and dashboard access.

LESS The 300,000 study, credited in full.

LICENCE Your own staff, and one named agency of record.

SETS The question set everyone after you inherits.

REFUNDED IN FULL

If fewer than 30 rights-clean stations carry your set on 30 Jun 2027. Renewal is 1,500,000 CZK a year, named in the paper and held while you stay.
