

IN-STORE SHOPPER MEASUREMENT

**You know what sold.
Nobody has shown you **who**
bought it.**

A channel read from the aisle: shoppers described, matched to the receipt, delivered as anonymous aggregates. Receipt-verified at 92% on cameras already in the stores.

🛡️ No facial recognition · Aggregates of 25+ only · Receipt-verified

01 · THE GAP YOU LIVE WITH

Syndicated data tells you what sold. **It has never told you who buys.**

Your evidence about the store is a receipt and a survey. The receipt has no person attached to it. The survey has a person, but not the one standing in the aisle at 17:40 on a Thursday. Between them sits the moment that actually decides your category, and it is unmeasured.

Sell-out arrives without a shopper

POS and panel feeds give you units, share and price. They cannot tell you which shopper picked you up, which one picked up the competitor, or which one walked past both without stopping.

Panels measure what people say

Claimed behaviour, recalled after the fact, from a sample projected onto a market. Useful for attitudes, weak for the two seconds in which a hand reaches for a pack.

In store is the unmeasured medium

Every other channel you buy reports who saw it and who converted. In-store activation is still judged against a baseline weeks later, with no idea who was exposed.

- ✓ Runs on cameras that already exist
- ✓ Matched to the receipt line
- ✓ Aggregates of 25+, always
- ✓ Live in weeks, not quarters

02 · WHAT WE ACTUALLY MEASURE

This is the resolution **the read is built from:** over 450 visual attributes.

What we capture

- ✓ **Who is there:** age band estimated with error bands, gender, group size, solo or family
- ✓ **How they shop:** route through the store, dwell by aisle, pickup and put-back, repeat traffic
- ✓ **What they present as:** style, garment category, pooled brand-worn signals
- ✓ **Matched to POS:** which visit became which receipt line, and which did not convert

ILLUSTRATIVE EXAMPLE

Pet aisle, Thursday 17:41: female, 25–34 band, 51s dwell, two SKUs handled, one purchased. Aggregated across every store and every day, published only at cell sizes of 25 or more.

How the read reaches you

- ✓ **The category read:** segment by SKU by daypart by store cluster, on a fixed refresh cycle
- ✓ **Custom cuts** on the questions your team is actually arguing about internally
- ✓ **A dashboard and a chat interface:** ask in plain language, no analyst in the loop
- ✓ **A method note** every time: what is measured, what is modeled, error bands on both

BUILT FOR YOUR INSIGHTS LEAD

Nothing in the read is a black box. Targets and holdouts are pre-registered before we run, and we report the nulls alongside the findings.

✓ No facial recognition

✓ No biometric templates

✓ No cross-visit tracking

✓ Images never leave the store

One read. **Three teams** that need different answers from it.

Sales & trade

Walk into the negotiation with your own evidence.

- ✓ Which shoppers the channel actually delivers, measured independently of the retailer's own numbers
- ✓ Which segments convert on your SKUs, by store cluster and daypart
- ✓ Where distribution is worth pushing, and where the channel simply does not carry your buyer

BUDGET: TRADE MARKETING, SALES OPS

Marketing

Close the loop on the last unmeasured medium.

- ✓ Exposed segment through to basket, observed in the store rather than modeled afterwards
- ✓ The segment that actually moves the category, not the one the persona deck assumes
- ✓ Segment shift before and after an activation, read in weeks instead of quarters

BUDGET: BRAND AND MEDIA

Product & insights

Observed behaviour instead of claimed behaviour.

- ✓ What this channel buys instead of you, at what price tier and in what pack format
- ✓ Which segments walk the aisle and find nothing in your line that fits them
- ✓ A method you can audit: pre-registered targets, holdouts, and nulls reported honestly

BUDGET: RESEARCH AND NPd

Every camera in retail points at the shelf. We turned one around.

Shelf vision is a solved and crowded product: it confirms the item is there and priced right. The camera pointed at the shopper, aggregated and matched to the receipt, is the one nobody has commercialised.

	LEGACY MEASUREMENT		MINDS & MODELS
What it looks at	Audited shelf photography, planogram scans and field surveys. Built to confirm the product is present and priced right.	→	The aisle, turned toward the shopper. Every visit becomes a shopper you can describe, then matched to the receipt.
What it tells you	What sold, sampled from a panel and projected onto the wider market, arriving weeks after the fact.	→	Who bought, observed continuously in the store, receipt-verified. Nothing projected, nothing extrapolated.
How it arrives	A static export on somebody else's schedule, in a format built for a market you do not sell in.	→	A live read plus a chat interface you can question in plain language, cut for the channel you actually sell in.

The join is real, and we will show you how it was measured.

CZK RECEIPTS MATCHED

21 days, one store, a leading Czech sports-nutrition retailer. Real receipt-level matching against live POS, not modeled.

Where the platform runs today

Sports nutrition	Pilot live, real receipt-level matching
Pet specialist	Instrumented, real receipt-level matching
Fuel & convenience	Network scoped, rollout in preparation
Property & landlord	Portfolio deployment live
Drugstore & beauty	In contracting

Retailer names are released only with the retailer's written consent. We will name them in a scoping call under NDA.

06 · HOW YOU BUY IT

Start with a study. Scale into a seat.

01 · STUDY

150–500k CZK

One category, one channel, roughly four weeks. Scoped and priced in writing before it starts. This is a one-off study, not a subscription, and we will tell you plainly if a study is all you need.

02 · FOUNDING SEAT

From €40k / year

Year one only, capped at three per category, at half of list price. Carries a density escrow: if instrumented coverage misses the threshold named in your contract, fees are refunded or credited.

03 · CHANNEL CURRENCY

At density

Once two or more chains in the category are instrumented, the read stops being a single-chain view and becomes a channel currency. It prices against the syndication line you already carry.

Three steps. The first one costs you nothing.

1

A 30-minute methodology session

We walk through the join, the privacy architecture and the error bands. Nothing confidential needed from your side. Bring your insights lead: this session is built for them.

2

A study on your category

Four weeks, scoped and priced in writing before it starts. If the answer would not be worth the money, we will say so at the scoping call rather than after the invoice.

3

A founding seat for 2027

From €40k a year, capped at three per category, with the density escrow written into the order rather than promised in a meeting.
