

You are spending on a shopper you have never seen. *Ask who they are.*

In-store is the largest discretionary line in a Czech FMCG business, and the only one still defended with the retailer's own sell-out curve.

● Forecourt & convenience

● Food retail

● Health & nutrition

● Pet specialist

WHERE THE MONEY GOES ON A GUESS

Three decisions you make every year, and cannot evidence when asked.

“Not looking at a tactic by tactic, because if we did it’s rarely going to be positive... we can’t get the clear reporting and the KPIs that we are essentially looking for.”

Marketing Director, Keurig Dr Pepper, on in-store proof

DECISION 1 · THE PROMOTIONAL LINE

How deep does the discount need to go?

👤 **Trade / shopper marketing manager.** Signs it out of podpora prodeje, and has no analyst to check it.

TODAY YOU DECIDE IT ON

Last year’s mechanic, and a sell-out curve that cannot separate the discount from the demand that was coming anyway.

DECISION 2 · THE ANNUAL NEGOTIATION

What do you put on the table in November?

👤 **Key account manager,** inside the commercial director’s conditions strategy for the roční jednání.

TODAY YOU DECIDE IT ON

A sell-out report, which describes the baskets that closed and, by construction, nobody else who was standing there.

DECISION 3 · THE BRIEF

Who is the next campaign actually aimed at?

👤 **Brand manager,** and the agency of record who builds the audience from whatever the brief says.

TODAY YOU DECIDE IT ON

A target definition written years ago, inherited from a brand team, never once checked against the people standing in the store.

WHY NONE OF IT ANSWERS THE THREE DECISIONS

Your data is good. But all three of your sources only start once somebody has already paid.

Which means the shopper who considered your category and walked away with nothing is missing from every one of them. **Not as a gap in data quality. By design.**

Sell-out

Exactly what left the store, by product, by week, by chain. Nothing you can buy measures the outcome more precisely, and it is the number your own bonus is written on.

BLIND SPOT

It begins at the moment of payment. Everyone who picked your product up and put it back again is missing from it, and always will be.

The loyalty card

Where a chain runs a real card programme, it genuinely links a basket to a household and follows it over time. It is the strongest who-answer on the market today.

BLIND SPOT

It only sees people carrying the card, and only baskets that were paid for. In a forecourt or convenience trip, most shoppers do neither.

The panel

Projectable, comparable year on year, and the only instrument here that can legitimately say “the market” rather than “this store”.

BLIND SPOT

It asks people to remember, weeks later. It was never in the store at the moment the choice was made, and your competitors buy the same one.

WHAT THE DATA IS MADE OF

Two records, joined into one.

The person standing there, and what they bought.

Who was in the store

What can be seen about the person standing in front of your product: age band with its error band, how they present, what they wear and carry, who they came in with, the hour they arrived. **About 88 such details per shopper**, from a vocabulary of 450+.

Privacy first. Nobody is identified, at any point, by design.

What they bought

The receipt itself: which products, the price actually paid against list price, the value of the whole basket, and the minute it was rung up. **Real receipt-level data**, not modelled and not a projection.

One row, per shopper

The person and the purchase, on the same line. Matched at **92%** where receipt-level data is live, and at no point does the system know who the person is.

DELIVERY

One slide you can defend on Monday. Not just another login.

- One slide, with its scope statement printed in its own footer, because it will be forwarded without us in the room.
- An Excel shaped like the report you already circulate, one row per category pair, with the count printed on every cell.
- A written read: one finding, one so-what, two or three moves. In an organisation with no analyst, the interpretation is the product.
- Asked in your own words. The same read answers follow-up questions in plain language, without a ticket to an analyst.

PRIVACY, IN ONE LINE

No facial recognition, no identities, no biometric templates, no cross-visit tracking. Aggregates only, published at $k \geq 25$. Age is **estimated with error bands**, never detected. The full AI Act role map, GDPR basis, DPIA and anonymisation model is a six-page pack, available on request.

Minds & Models · ask · illustrative example

Compare promo share of spend for  Night Dorm,  Dawn Trades and  Value Senior, indexed against the store average.

Dawn Trades pays list. They buy the same two items before 07:00 whether or not anything is on promotion, and index at 41 against the store.

How this was counted: receipt lines joined to observed visits · promo flag from price paid against list · 4 segments, each above the $k \geq 25$ floor. **Illustrative example, not a measured result.**

Dawn Trades

Trades and shift workers buying the same two things before 07:00

- TELL** Company-logo hi-vis, can already in hand at 06:10.
- BUYS** Same SKU daily. Promo-indifferent: habit beats price.
- MOVE** Stop funding depth here. Fund availability and speed instead.

FOUNDING SEATS

Three founding seats per category.

The first one sets the questions.

- ☆ **The founding seat writes the question set.** The categories, the cuts and the cadence of the read are set by whoever is first, and everyone after inherits them.
- 📊 **Nobody else in your category has this read.** It is the only line on your data shelf that is not commodity parity with your two closest competitors.
- 📋 **It comes out of trade and shopper marketing.** Not research, not innovation. It replaces nothing, and it is a test, not a source of record.

Forecourt & convenience	SEATS OPEN
Food retail	SEATS OPEN
Health & nutrition	SEATS OPEN
Pet specialist	SEATS OPEN

THE FIRST STEP IS SMALL ON PURPOSE

A bounded proof, not a subscription.

Length	8 to 12 weeks, on live stores
Output	One hard before-and-after number
Purpose	One decision you make differently
Budget line	Trade / shopper marketing

WHAT WE NEED FROM YOU

Thirty minutes, and the name of whoever checks numbers before they enter an internal deck. **The method annex goes to them before we meet**, so that validating us costs them an hour instead of a week.
