

● Pre-seed 2026

Minds & Models

Online-grade behavioral data. Now from a physical shelf.

Insights nobody has been able to produce before. They cannot be scraped, and they cannot be bought.

02 · THE PROBLEM

Consumer brands do not know who buys them.

Online they have known for twenty years. In a shop, nobody ever wrote it down.

What they rely on instead

EXPENSIVE

Consumer panels

- A few thousand households, reporting on themselves, months late

BLIND

Checkout data

- Every basket ever sold, with no person attached to any of them

SCARCE

Loyalty cards

- One chain only, and nothing on anyone who did not scan a card

18 billion dollars a year buys the what was sold. Nobody sells the who bought it.

Global consumer measurement spend, NIQ Form S-1 (SEC, 2025). Ecommerce takes 7.2% of global grocery spend (Kantar Worldpanel), so nine in ten grocery euros are spent in a store.

Every store already produces two data sets. **Nobody has ever joined them.**

WHO

The shopper

- 100+ visual attributes per shopper
- Read on the edge, nothing identifiable leaves the store

Observed, not declared. Not scraped, not generated

WHAT

The receipt

- Every line, every basket, every store
- The retailer's own POS feed, already clean

Exists already. This is the half that already gets sold

↓ MATCHED AT THE VISIT ↓

THE RESULT

Who bought what.

A model of how people shop physical retail, queried in plain language. **The join is the product, and nobody else has it.**

04 · WHO PAYS FOR WHAT

The side that has the data does not pay. The side that needs it does.

SUPPLY

The retailer

€0 Pays nothing, ever

GIVES

- The cameras it already owns, plus its POS feed
- A perpetual aggregate license, anonymized and chain-masked

GETS

- A revenue share on data it never had to collect
- The same read back, at no cost

DEMAND

The brands

€40k → €170k Per category, per year

GIVES

- A measurement budget that already exists
- No exclusivity, one read sold to every brand in the category

GETS

- Who bought, matched to what sold
- A read that gets deeper every year

WHAT A BRAND PAYS, PER CATEGORY, PER YEAR · AND WHY OUR REVENUE OUTFRUNS OUR COST

Cost scales with stores. Revenue scales with seats. Every new chain deepens every read already running, so the same store earns more each year.

25×	125×	4.9×
stores deployed	ARR	ARR per store

You are spending on a shopper you have never seen. **Ask who they are.**

Ask anything, or @ a segment to name who you mean

Ask @Dawn Trades

Ask #energy drinks

Ask #convenience stores

Ask @Young Streetwear

Ask #deodorant

Segments are discovered in the data, not authored by a marketer.

PROMOTION EFFICIENCY

“Who pays full price for deodorant, and who waits for the promotion?”

→ Stop funding discount on the segment that would have paid anyway

CHANNEL STRATEGY

“How does our shopper mix differ between convenience and drugstores?”

→ Different pack size, price tier and listing argument per channel

AUDIENCE BUILDING

“Which competitor's shopper looks most like ours, and where do they overlap?”

→ Aim the switching campaign at the audience that is actually winnable

VISUAL DATA POINTS

18,830,280

Interpreted shopper signal, not raw footage

POS DATA POINTS MATCHED

484,120

Each one joined to the visit that produced it

Every store-month adds to the same thing: **an owned, interpreted corpus of real-world visual shopper data**, tied to verified purchases. It is the one part of this business that cannot be rebuilt by spending more.

Software multiples are compressing. Owned data is not.

01 Bottom-up financial model Ending ARR, EUR millions

21.3M EUR of ARR on 5.7M EUR of total capital. EBITDA positive from December 2030, 19.9% in the final quarter. 26 chains, 1,500 instrumented stores, 156 brand seats.

02 Exit mathematics What it is worth where that curve ends

ARR at the end of the plan 21.3M

×

Revenue multiple for an owned data asset 8–10×

=

What the company is worth then 170–213M

WHY A DATA MULTIPLE AND NOT A SOFTWARE ONE

A buyer is not acquiring software here. It is acquiring an **owned corpus of physical-world shopper data** and the signed cross-chain rights underneath it. Listed data businesses trade at **8.9–14.1× revenue**, the median software acquisition at **4.5×**.

03 Top-down sanity check Is the market actually big enough to hold the plan

\$18bn

The global consumer measurement market, as its largest company sizes it
NIQ Form S-1, SEC, 2025

→

23,000

Companies already paying that one company, about \$173k a year each
NIQ Form S-1, average implied

→

156

Brand seats is our entire 2031 plan. **0.7% of that one client list.**

09 · WHAT WE ARE RAISING, AND WHAT IT BUYS

500k EUR turns pilots into a signed, paying business.

WHERE THE BUSINESS IS AT THE NEXT ROUND

2

retail chains under a perpetual data mandate

4

categories reading continuously, month after month

9

brands paying for a seat, billed a year in advance

742k

EUR of run-rate ARR, signed and invoiced

WHY THIS IS THE MOMENT

Models stopped being the moat.

Every fund now asks what a competitor could not copy with more money. Ours is a signature per retail chain, and signatures do not move faster for capital.

Real-world data became the scarce input.

The public corpus is used up. 47.4bn USD went into physical AI in the first half of 2026, chasing behavior nobody ever recorded.

The rights are still unclaimed.

A chain grants its data mandate once. In our markets nobody has asked yet, and the first signature closes the category.
