

You are spending on a shopper you have never seen. *Ask who they are.*

For the first time, that shopper can be described rather than surveyed,
on live stores, joined to the receipt.

WHERE THE MONEY GOES ON A GUESS

Three decisions you make every day, and cannot back up when someone asks.

TRADE MARKETING · THE PROMOTIONAL LINE

Which shoppers am I discounting who would have bought anyway?

Sell-out is your only proof that a promotion worked, and it arrives weeks later in the chain's own format. It cannot tell the display from the leaflet from the week.

Why it is hard: in sell-out, the two look identical.

CATEGORY AND KAM · THE ANNUAL NEGOTIATION

Who walked out without my category, and what did they buy instead?

Scan data says what sold. A 2,000-household panel says what people remember buying. Neither one was standing next to the shopper who chose somebody else.

Why it is hard: that shopper is in no file you own.

BRAND MARKETING · THE BRIEF

My brief targets under-30s. Who is actually at the shelf?

Your target definition came from a tracker, a panel and the agency's segmentation, and every one of them describes a household rather than a person in an aisle.

Why it is hard: you are briefing on a stranger.

WHY NONE OF IT ANSWERS THE THREE DECISIONS

Each of your data sources answers one question.
None of them answers one shopper.

Good data, all of it. None of it joined on the person standing in front of your product.

	WHO WAS STANDING THERE	WHAT THEY BOUGHT	WHO DID NOT BUY YOU	IN THE STORE, AS IT HAPPENS
Sell-out your chain's EPOS report	 a line item	 exactly what sold	 your buyers only	 weekly, in arrears
The loyalty card the chain's own CRM	 self-declared	 card baskets only	 only on card	 live, as scanned
The consumer panel NielsenIQ, Kantar, GfK	 recalled, then projected	 from memory	 projected, never seen	 questionnaire, weeks later
Minds & Models	 88 attributes, everyone	 every receipt, matched	 seen either way	 live, at payment

Read across, not down. Which is why “who actually buys this” is still an opinion in your building.

HOW THE DATA GETS MADE

Two records. One shopper.
Joined on the same visit.

Who was in the store

The **visual signature** of the person standing in front of your product: age band with its error band, how they present, what they wear and carry, who they came in with, the hour they arrived. **88 visual attributes**, from a vocabulary of 450+.

- spending tier
- logo prominence
- watch type
- +85 more

What they bought

The **receipt itself**: which products, the price actually paid against list price, the value of the whole basket, and the minute it was rung up. **Every claim has a receipt behind it.**

Real receipt-level data. Not modelled, and not a projection.

One row, per shopper

105 DATA POINTS

Dawn Trades Trades and shift workers buying the same two things before 07:00

seen_at 06:12, Tue	store_id station	age_est 35-39	upper_brand engelbert strauss
wears_hi_vis yes	shoe_type work_boots	carried_item thermos	shopping_tool plastic_bag
outfit_functionality workwear	apparel_condition heavily_worn	apparent_spending_tier mid_range	individual_activity paying
bought Monster +2 items	price_paid_vs_list full price	basket_value_czk 118.40	+90 more

This row already exists **492,000 times**. Look at enough of them and the same combinations keep coming back, and that is what the groups on the next page are.

WHERE THE SEGMENTS COME FROM

From big data to shopper segments.

People you can actually brief against.

Shoppers who resemble each other pull together, and those groups are the segments. **Nobody drew them, and what reaches you is a person, not a cluster.**

DELIVERY

One slide you can defend on Monday. Or the Excel. Or the one-pager. Just ask.

Think of it as the analyst you were never given. It knows your category, it is there on Sunday night, and it answers in whatever shape Monday needs.

- 📄 **“Give me the one slide.”** With its scope statement printed in its own footer, because it will be forwarded without us in the room.
- 📊 **“Give me the full Excel.”** Shaped like the report you already circulate, one row per category pair, with the count printed on every cell.
- 📁 **“Give me the one-pager.”** One finding, one so-what, two or three moves. In an organisation with no analyst, the interpretation is the product.
- 🗣️ **“Now split that by hour.”** Follow-ups in your own words, answered on the spot, without a ticket to an analyst.

THE FOUNDING MEMBERS' CLUB

Three seats at the founding price.

The first one shapes what it measures.

WHAT A SEAT IS

**A brand membership in one category read**

One channel, one chain, one group of competing houses.

**Three founding brand seats**

A hard cap of three at the founding price, and no fourth. The first brand in is reading its own category while the rest of the set is still deciding whether to look.

**The first member shapes the platform and the data**

Founding brands come in as design partners: what gets measured, which cuts, what the outputs look like. You are in the room while it is built, not picking from a menu afterwards.

Let's start small — the first three steps**1 Tell us the category and the chain**

One sentence by email. We come back with whether those stores are already instrumented, and what we could answer about them today.

2 One study, one question

A question you already argue about internally, answered on live stores. Paid on delivery, no deposit, and the fee comes off the seat in full.

3 Take the seat, or stop

If it changed a decision, you take one of the three. If it did not, you stop, and you have paid for one study.
